Subject: Subject case dermal exposures

Anastasia -

Thank you for our discussions yesterday and today.

We resolved the filter handling scenario in manufacturing.

Since the 50% only applied to the filtered portion, and there are multiple other dermal exposure activities down the process line which assesses at 99.5%, that you are fine with using the same two handed contact model for this exposure. For risk assessment, the highest dermal exposure is utilized for MOE calculations.

This dermal exposure for risk assessment would now be 2200 mg/day, refined from 3080 mg/day, as the other exposures for loading and unloading the pmn substance.

The report - Post Focus draft revision 2, will be updated accordingly. And a call report was added to this revision.

Please feel free to call (202-564-8523) with any questions.
